

Our group decides to make product sale web page after discussion. Rolls-Royce is the product we are selling this time. At the main page, customers are able to know product history and get contact information. There's a button near discover more created for customers if they are interested in getting more information about the product.

There's a nav bar at the top left of main page which provides some kind of convenient for customers to directly go to each car model.

At the product pages customers are able to see model pictures, model descriptions and price.

There're four terms in the footer section, which would provide more information about Company, Contact, Subscribe and Legal if they're interested, after click these links, it would direct customers to the certain webpage.

When customer wants to place an order, they can click "order now" button in the product page, which would asking them to fill some basic informations such as customer name, product name and quantity. These information would be restored in the database. We have four tables in the database, customer table, product table, transaction table and order order history table. Order history table has customerID and productID as references to customer table and product table.
